★**blister-beetle** (blis'tėr-bē″tl), *n.* A popular name of beetles of the family *Meloidæ*, derived from the peculiar poison (cantharidin) which is contained in their tissues. This poison, when brought into contact with the skin, produces blisters, and on account of this vesicatory property the dried beetles are largely used in medicine. In their earlier states the blister-beetles are parasitic on grasshopper-eggs or in the cells of mason-bees. The imagos of many American species are often very injurious to field- and garden-crops. The development of the larva, which assumes successively several forms, is very remarkable. See *hypermetamorphosis* and *Epicauta*.

According to Percy, these blisters are probably due to the reduction of a part of the protoxid of iron existing in the mass in the form of a silicate of the protoxid, and the consequent evolution of carbonic oxid. The process is a very old one.

blizzard (bliz'ärd), *n.* [A dial. var. of *blizzer* (as *gizzard* for earlier *gizzer*, *dizzard* for *dizzer*, *disour*, *vizard* for *vizzer*, *visor*, etc.), which is a dial. form of *bleezer* (with *ee* or *i* shortened to *i*, as in *breeches*, *been*, obs. *brizze* for *breeze*[1], an insect, etc.), *bleezer* being from *bleeze*[1] (with a dial. var. *blizz*), as *blazer* is from the ult. identical *blaze*[1]. The word existed almost unrecognized in E. prov. use, whence it passed into Amer. use. First used and noticed locally on the Atlantic coast, it was carried thence to the West, where, in a special application, it came into general notice and use in the winter of 1880–81. As now used, the word rests on what to the popular consciousness is the common root of *blaze*, *blast*, *blow*.] **1.** A sudden and vehement storm of wind, rain, or snow; a blast. [Prov. I overtook four of our boys in blue, under a corporal, tenderly carrying to the rear a stretcher on which lay a wounded rebel. . . . He had ridden right in on top of the 6th Conn. regiment, and our boys had given him what we called "a *blizzard*."

Craven (1866), Prison Life of Jefferson Davis, p. 13.

Along the Atlantic coast, among the gunners who often hunt in parties stationed near together behind blinds, waiting for the flocks of migratory birds, the word *blizzard* means a general discharge of all the guns, nearly but not quite together—a rattling volley, differing from a broadside in not being quite simultaneous. This use of the word is familiar to every 'longshore man from Sandy Hook to Currituck, and goes back at least forty years, as my own memory attests.

From it the solid tissues take their food and oxygen, and into it they discharge their waste products. The blood is red in vertebrates, except amphioxus, and colorless, red, bluish, greenish, or milky in other animals. In passing through the lungs (see *circulation*) it is oxygenated and gives up carbon dioxid; then, after passing through the heart, it is carried as *arterial* blood by the arteries to the tissues; from the tissues it is returned to the heart through the veins, deprived of its nutrient properties, as *venous* blood. The venous blood of the *Craniota* is dark-red, the arterial bright-scarlet. The specific gravity of human blood in health is 1.050. The blood consists of a fluid pale-yellow plasma and semi-solid corpuscles; the latter constitute between one third and one half of it; they are of two kinds, red and white. In a cubic millimeter of healthy human blood there are about 4,500,000 corpuscles, the red being to the white on the average about as 560 to 1. The red corpuscles are flat biconcave disks, non-nucleated and almost always round in mammals, and nucleated and almost always oval in other *Craniota*. Their diameter averages in man about 7.0 micromillimeters ($\frac{1}{3600}$ inch), while in *Amphiuma tridactylum* the longer diameter is 67.2 micromillimeters ($\frac{1}{383}$ inch). Their color is due to hemoglobin, which constitutes about 90 per cent. of their dried substance. The white corpuscles are nucleated, slightly larger than the red in man, and exhibit active amœboid movements. Animal blood is used in clarifying sugar, in making animal charcoal, and in many other ways. See the supplement.

An instrument by which a current of air or gas is driven through the flame of a lamp, candle, or gas-jet, to direct the flame upon a substance, in order to fuse it, an intense heat being created by the rapid supply of oxygen and the concentration of the flame upon a small area. In its simplest form, as used, for example, by gas-fitters, it is merely a conical tube of brass, glass, or other substance, usually about 7 inches long, ¾ inch in diameter at one end, and tapering so as to have a very small aperture at the other, within 2 inches or so of which it is bent nearly at a right angle. The blowpipe of the mineralogist is provided with a small chamber near the jet, in which the moisture from the mouth collects. The current of air is often formed by a pair of bellows instead of the human breath, the instrument being fixed in a proper frame for the purpose. The most powerful blowpipe is the oxyhydrogen or compound blowpipe, an instrument in which oxygen and hydrogen (in the proportions necessary for their combination), propelled by hydrostatic or other pressure, and coming from separate reservoirs, are made to form a united current in a capillary orifice at the moment when they are kindled. The heat produced is such as to consume the diamond and to fuse or vaporize many substances refractory at lower temperatures. The blowpipe is used by goldsmiths and jewelers in soldering, by glass-blowers in softening and shaping glass, and extensively by chemists and mineralogists in testing the nature and composition of substances. Also called by workmen a *blowing-iron*.

(*b*) Heated; inflamed; bursting with passion: as, *boiling* indignation.—**Boiling spring,** a spring or fountain which gives out water at the boiling-point or at a high temperature. The most remarkable boiling springs are the geysers, which throw up columns of water and steam; but there are many others in various parts of the world, often associated with geysers, characterized only by ebullition and emission of steam. Some of the latter, as in California and New Zealand, are strongly impregnated with mineral matters and variously colored, while others are charged with liquid mud. See *geyser.*

boilingly (boi′ling-li), *adv.* In a boiling manner.

> The lakes of bitumen
> Rise *boilingly* higher. *Byron,* Manfred, i. 1.

★**boiling-point** (boi′ling-point), *n.* The temperature at which a liquid is converted into vapor with ebullition; more strictly, the temperature at which the tension of the vapor is equal to the pressure of the atmosphere. This point varies for different liquids, and for the same liquid at different pressures, being higher when the pressure is increased, and lower when it is diminished. Under the normal atmospheric pressure (see *atmosphere*) water boils at 212° F. (100° C., 80° R.), and it is found that the boiling-point varies .88 of a degree F. for a variation in the barometer of half an inch. Hence water will boil at a lower temperature at the top of a mountain than at the bottom, owing to diminution in the pressure; a fact which leads to a method of measuring the height of a mountain by observing the temperature at which water boils at the bottom of the mountain and at the top. At the top of Mont Blanc water boils at 185° F. Under a pressure of about $\frac{1}{125}$ of an atmosphere water would boil at 40° F., while under a pressure of 10 atmospheres the boiling-point would be raised to 356° F. A liquid may be heated much above its true boiling-point without boiling; but the superheated vapor immediately expands until its temperature is reduced to the boiling-point. Hence, in determinations of the boiling-point, the thermometer is never immersed in the liquid, but in the vapor just above it.—**Kopp's law of boiling-points,** the proposition that in certain homologous series of chemical substances each addition of CH_2 is accompanied by a rise in the boiling-point of about 19°.5 C.

It is used by throwing it in such a way that the line winds around the object aimed at, as the legs of an animal. A smaller weapon of the same sort is in use among the Eskimos for killing birds.

The *bolas*, or balls, are of two kinds: the simplest, which is used chiefly for catching ostriches, consists of two round stones, covered with leather, and united by a thin, plaited thong, about eight feet long. The other kind differs only in having three balls united by thongs to a common centre. The Gaucho holds the smallest of the three in his hand, and whirls the other two around his head; then, taking aim, sends them like chain shot revolving through the air. the shattering force of shells. Such structures are made in a variety of ways, but are usually, at least in part, beneath the level of the ground. They may be entirely of metal, so shaped that shot and shell will glance from the surface without piercing them, or they may be of vaulted masonry, or even of timber covered and faced with massive embankments of earth, the latter forming the most effective shield against modern projectiles. Bomb-proofs are provided in permanent and often in temporary fortifications to place the magazine and stores in safety during a bombardment, and also to afford shelter to the garrison or to non-combatants.

A Linnean genus of lepidopterous insects, now the type of the family *Bombycidæ.* The caterpillar of the *Bombyx mori* is well known by the name of *silkworm.* When full-grown it is 3 inches long, whitish-gray, smooth, with a horn on the penultimate segment of the body. It feeds on the leaves of the mulberry (in the United States also on those of the Osage orange), and spins an oval cocoon of the size of a pigeon's egg, of a close tissue, with very fine silk, usually of a yellow color, but sometimes white. Each silk-fiber is double, and is spun from a viscid substance contained in two tubular organs ending in a spinneret at the mouth. A single fiber is often 1,100 feet long. It requires 1,600 worms to produce 1 pound of silk. Greek missionaries first brought the eggs of the silkworm from China to Constantinople in the reign of Justinian (A. D. 527–565). In the twelfth century the cultivation of silk was introduced into the kingdom of Naples from the Morea, and several centuries afterward into France. The silkworm undergoes a variety of changes during the short period of its life. When hatched it appears as a black worm; after it has finished its cocoon it becomes a chrysalis, and finally a perfect cream-colored insect or moth, with four wings. For other silk-spinning bombycids, see *silkworm.* See cut in next column.

consisting of branching cells lying in an intercellular substance made hard with earthy salts (consisting of calcium phosphate with small amounts of calcium carbonate and magnesium phosphate, etc.), and forming the substance of the skeleton or hard framework of the body of most vertebrate animals. When the earthy salts are removed, the remaining intercellular substance is of cartilaginous consistency, and is called ossein or bone-cartilage.

Through the substance of *bone* are scattered minute cavities—the lacunæ, which send out multitudinous ramifications, the canaliculi. The canaliculi of different lacunæ unite together, and thus establish a communication between the different lacunæ. If the earthy matter be extracted by dilute acids, a nucleus may be found in each lacuna; and, . . . not unfrequently, the intermediate substance appears minutely fibrillated. . . . In a dry bone, the lacunæ are usually filled with air. When a thin section of such a bone is . . . covered with water and a thin glass, and placed under the microscope, the air in the lacunæ refracts the light which passes through them in such a manner as to prevent its reaching the eye, and they appear black. . . . All bones, except the smallest, are traversed by small canals, converted by side branches into a net-work, and containing vessels supported by more or less connective tissue and fatty matter. These are called Haversian canals. *Huxley and Youmans*, Physiol., § 350.

2. One of the parts which make up the skeleton or framework of vertebrate animals: as, a *bone* of the leg or head. They are also extensively employed as a ma-

nure for dry soils, with the very best effect, being ground to dust, bruised, or broken into small fragments in mills, or dissolved in sulphuric acid. The great utility of bones as a manure arises from the phosphate of lime they supply to the soil.

book (bůk), *n.* [Early mod. E. also *boock, bock;* < ME. *book, booke, boke, bok* (north. *buk, buke,* > Sc. *buik, beuk, buke*), < AS. *bōc* (pl. *bēc*), f., a writing, record, charter, book, = OS. *bōk* = OFries. *bōk* = MD. *boeck*, D. *boek* = OLG. *bōk*, LG. *book* = OHG. *buoh*, MHG. *buoch*, G. *buch*, neut., = Icel. *bōk*, f., = Sw. *bok* = Dan. *bog*, book, = Goth. *bōka*, f., *bōk*, neut., a letter of the alphabet, pl. a writing, document, book (cf. OBulg. *bukui*, letter, in pl. writing, *bukvarĭ*, abecedarium, Bulg. Russ. *bukva*, letter; from the Teut.), orig. Teut. **bōks*, a leaf, sheet, or tablet for writing; usually referred, in spite of philological difficulties, to AS. (etc.) *bōc* (usually in deriv. form *bēce*, beech), cf. AS. *bōcstæf*, early mod. E. as if **bookstaff* or **buckstaff*) (= OS. *bōkstaf* = MD. *boeckstaf*, D. *boekstaaf* = OHG. *buohstab*, MHG. *buochstap*, G. *buchstabe* = Icel. *bōkstafr* = Sw. *bokstaf* = Dan. *bogstav*), a letter of the alphabet, lit. appar. 'beech-staff' (< AS. *bōc*, beech, + *stæf*, staff), an interpretation resting on the fact, taken in connection with the similarity of form between AS. (etc.) *bōc*, book, and *bōc*, beech, that inscriptions were made on tablets of wood or bark, presumably often of beech (Venantius Fortunatus, about A. D. 600, refers to the writing of runes on tablets of ash; cf. L. *liber*, book, *liber*, bark, Gr. *βιβλίον*, book, *βίβλος*, book, papyrus: see *liber, Bible, paper*); but AS. *bōcstæf*, if lit. 'beech-staff,' would hardly come to be applied to a single character inscribed thereon; it is rather 'book-staff,' i. e., a character employed in writing, < *bōc*, a writing, + *stæf*, a letter (cf. *rūn-stæf*, a runic character, *stæf-cræft*, grammar). The connection with *beech*[1] remains uncertain: see *beech, buck*[7].] 1†. A writing; a written instrument or document, especially one granting land; a deed. The use of books or written charters was introduced in Anglo-Saxon times by the ecclesiastics, as affording more permanent and satisfactory evidence of a grant or conveyance of land than the symbolical or actual delivery of possession before witnesses, which was the method then in vogue.

By that time will our *book*, I think, be drawn.
Shak., 1 Hen. IV., iii. 1.

Come, let 's seal the *book* first,

The first, second and fourth of these divisions are purely religious, and require no detailed examination. Five and six are merely formal, useful only in questions of chronology and genuineness, or as proof of the presence of a Witan. The third division is the grant, which contains all the important legal matter of the charter. *H. Cabot Lodge.*

Lastly, there was bocland, or bookland, the land held in several property under the express terms of a written instrument, or *book* as it was then called.

bookkeeper (bůk′kē″pėr), *n.* One who keeps accounts; one whose occupation is to make a formal balanced record of pecuniary transactions in account-books.

bookkeeping (bůk′kē″ping), *n.* The art of recording pecuniary transactions in a regular and systematic manner; the art of keeping accounts in such a manner as to give a permanent record of business transactions from which the true state or history of one's pecuniary affairs or mercantile dealings may at any time be ascertained. Properly kept books show what a merchant has, what he owes, and what is owing to him, as well as what sums he has received and paid, the losses he has incurred, etc. Books are kept according to one of two chief methods, viz., by *single* or by *double entry*. The former is more simple and less perfect than the latter, and is now in use chiefly in retail business. In *bookkeeping by single entry*, three books, a day-book, a cash-book, and a ledger, are commonly used, but the essential book is the ledger, containing accounts under the names of the persons with whom a trader deals, goods or money received from any one of them being entered on one side of the account, called the credit side, and goods sold or money paid to that person being entered on the opposite or debit side of the account. In *bookkeeping by double entry*, the ledger accounts are of two kinds, personal accounts such as those just described, and book-accounts, in which the commodities dealt in are made the subjects of separate accounts, and have a debit and a credit side, as in personal accounts. Thus, if a trader purchase 100 bales of cotton from A. B., the account in the ledger headed A. B. is *credited* with 100 bales of cotton, so much, while the account headed Cotton is *debited* with the same quantity and amount; should the trader sell 10 bales to C. D., the account headed C. D. is *debited* with 10 bales at so much, and the account headed Cotton is *credited* with 10 bales; and so on. These book-accounts are based on the principle that all money and articles received become debtors to him from whom or to that for which they are received, and, on the other hand, all those who receive money or goods from us become debtors to cash or to the goods. In this way every transaction is entered in the ledger on the creditor side of one account and on the debtor side of another. The books used in double entry vary in number and arrangement according to the nature of the business and the manner of recording the facts. Transactions as they take place from day to day are generally recorded in such books as the stock-book, cash-book, bill-book, invoice-book, and sales-book, or they may all be recorded in order in a waste-book or day-book. Upon these books or additional documents are based the journal and ledger. The former contains a periodical abstract of all the transactions recorded in the subordinate books or in documents not entered in these, classified into debits and credits, while the latter contains an abstract of all the entries made in the former, classified under the heads of their respective accounts.

book-knowledge (bůk′nol″ej), *n.* Knowledge gained by reading books, in distinction from that obtained through observation and experience.

bookland (bůk′land), *n.* [Also *bockland*, often cited in the old legal form *bocland*, < AS. *bōcland*, < *bōc*, charter, book, + *land*, land.] In *old Eng. law*, charter land, held by deed under certain rents and free services; free socage land. This species of tenure has given rise to the modern freeholds.

> The title to *boc-land* was based upon the possession of a *boc*, or written grant.
> *D. W. Ross*, German Land-holding, Notes, p. 170.

> This process of turning public property into private went on largely in later times. The alienation was now commonly made by a document in writing, under the signatures of the King and his Witan; land so granted was therefore said to be booked to the grantee, and was known as *bookland*. *E. A. Freeman*, Norm. Conq., I. 64.

3. One who makes a book (see *book*, *n.*, 9) on a race or other doubtful event; a professional betting man. See extract.

> In betting there are two parties—one called "layers," as the *book-makers* are termed, and the others "backers," in which class may be included owners of horses as well as the public. The backer takes the odds which the *book-maker* lays against a horse, the former speculating upon the success of the animal, the latter upon its defeat; and taking the case of Cremorne for the Derby of 1872, just before the race, the *book-maker* would have laid 3 to 1, or perhaps £1000 to £300 against him, by which transaction, if the horse won, as he did, the backer would win £1000 for risking £300, and the *book-maker* lose the £1000 which he risked to win the smaller sum. At first sight this may appear an act of very questionable policy on the part of the *book-maker*; but really it is not so; because, so far from running a greater risk than the backer, he runs less, inasmuch as it is his plan to lay the same amount (£1000) against every horse in the race, and as there can be but one winner, he would in all probability receive more than enough money from the many losers to pay the stated sum of £1000 which the chances are he has laid against the one winner, whichever it is. *Eng. Encyc.*

In later use some assume also an allusion to *boom*[2], *n.,* 3. When a boom of logs breaks, the logs rush with violence down the stream, and are then said to be "booming"; but this appears to be the ordinary ppr. adj. *booming,* roaring, rushing with violence, and to have no connection with *boom*[2], *n.* or *v.*] **I.** *intrans.* To go on with a rush; become suddenly active; be "lively," as business; be prosperous or flourishing. J. B. McCullagh, in St. Louis Globe-Democrat, July 18, 1878.

Mr. McCullagh, in a letter to one of the editors of this Dictionary, says: "I cannot explain how I came to use it, except that, while on the gunboats on the Mississippi river during the war, I used to hear the pilots say of the river, when rising rapidly and overflowing its banks, that it (the river) was 'booming.' The idea I wished to convey was that the Grant movement was rising—swelling, etc. The word seemed to be a good one to the ear, and I kept it up. It was generally adopted about a year afterward. I used it as a noun after a while, and spoke of 'the Grant boom.'"]

They all say that one railroad spoils a town, two bring it to par again, and three make it *boom.*

boomerang (bö′me-rang), *n.* [Recently also *boomering, bomerang, bomarang;* from a native name in New South Wales; *wo-mur-rāng* and *bumarin* are cited as aboriginal names of clubs.] 1. A missile weapon of war and the chase, used by the aborigines of Australia, consisting of a rather flat piece of hard wood bent or curved in its own plane, and from 16 inches to 2 feet long. Generally, but not always, it is flatter on one side than on the other. In some cases the curve from end to end is nearly an arc of a circle, in others it is rather an obtuse angle than a curve, and in a few examples there is a slight reverse curve toward each end. In the hands of a skilful thrower the boomerang can be projected to great distances, and can be made to ricochet almost at will; it can be thrown in a curved path, somewhat as a bowl can be "screwed" or "twisted," and it can be made to return to the thrower, and strike the ground behind him. 2. Pertaining to or fit for a boor.

=Syn. *Boorish*, *Churlish*, *Clownish*, *Loutish*. He who is *boorish* is so low-bred in habits and ways as to be positively offensive. He who is *churlish* offends by his language and manners, they being such as would naturally be found in one who is coarse and selfish, and therefore generally insolent or crusty and rough; the opposite of *kind* and *courteous*: as, it is *churlish* to refuse to answer a civil question. The opposite of *boorish* is *refined* or *polite*; the opposite of *clownish* is *elegant*. *Clownish* is a somewhat weaker word than *boorish*, implying less that is disgusting in manner and speech; it often notes mere lack of refinement. The difference between *clownish* and *loutish* is that he who is *clownish* is generally stupid and sometimes ludicrous, while he who is *loutish* is perhaps slovenly and worthy of blame.

boot[2] (bōt), *n.* [< ME. *boote, bote,* < OF. *bote,* a boot, F. *botte* = Pr. Sp. Pg. *bota* (ML. *bota, botta*) (compare Gaelic *bot,* from English), a boot; prob. orig. a popular application of OF. *bote, boute,* mod. F. *botte,* = It. *botta, botte* (ML. *butta, bota*), a butt, cask, leathern vessel: see *butt*[3].] 1. A covering (usually of leather) for the foot and lower part of the leg, reaching as far up as the middle of the calf, and sometimes to the knee. In most styles the leg part keeps its place by its stiffness alone, although in certain fashions it has been laced around the calf. Boots seem to have appeared in Europe about the middle of the fifteenth century. They were not much worn at first, because persons of the wealthier classes, when abroad, were generally clad in armor. At the time of the gradual disappearance of armor very high boots of thick leather came into favor as covering for the legs, and by the sixteenth century they were already in common use. (See *jack-boot.*) Late in the eighteenth century boots became a usual part of elegant costume, and were made lighter and more close-fitting. In England boots ceased to be common in elegant costume as early as 1855, and about fifteen years later they began to disappear in the United States; but they are still worn for special purposes and occupations, as by horsemen, seamen, etc.

An instrument of torture made of iron, or a combination of iron and wood, fastened on the leg, between which and the boot wedges were introduced and driven in by repeated blows of a mallet, with such violence as to crush both muscles and bones. The boots and thumb-screw were the special Scotch instruments for "putting to the question." A much milder variety consisted of a boot or buskin, made wet and drawn upon the legs and then dried by heat, so as to contract and squeeze the legs.

It is a white crystalline solid, slightly soluble in cold water, having a sweetish alkaline taste. It occurs in nature in solution in the water of lakes in Tibet, Tatary, China, and California, and is obtained from these waters by evaporation and crystallization. The United States is now almost wholly supplied with borax from California. Borax is also prepared artificially from soda and boracic acid. It is much used as a flux in assaying operations, and for cleaning the surfaces of difficultly fusible metals previous to soldering, since when melted it dissolves the metallic oxids which form on their surfaces when heated. It is also used in glass and enamel manufacture; as an antiseptic, particularly in foods, because its action on the system is feeble even in comparatively large doses; and as a detergent. (*d*) In *her.*, the outer edge of the field when of different tincture from the center. Its width is uniform, and should be one fifth the width of the field. bore[2] (bōr), *n.* [Early mod. E. also *boar*, *boer*; appar. < ME. *bare*, a wave, billow (once, in doubtful use) (cf. F. *barre*, a bore); prob. < Icel. *bāra* = Norw. *baara*, a billow caused by wind; cf. Sw. dial. *bår*, a hill, mound; prob. connected with Icel. *bera* = E. *bear*[1].] An abrupt tidal wave which breaks in an estuary, the water then rushing up the channel with great violence and noise. The tidal wave being a wave of translation, the shoaling and narrowing of channels where the tide rises very rapidly produce a great increase in the height of the wave. The forward parts of the wave, too, in shoaling water advance less rapidly than the backward parts, and so cause a great accumulation in front. The most celebrated bores in the old world are those of the Ganges, Indus, and Brahmaputra. The last is said to rise to a height of 12 feet. In the Amazon and other rivers in Brazil the bore reaches a height of from 12 to 16 feet. In England the bore is observed more especially in the Severn, Trent, and Wye, and in the Solway Frith. The bores in some estuaries at the head of the Bay of Fundy are remarkable. In some parts of England it is called *eager* (which see); on the Amazon, the *prororoca*; on the Seine, the *barre*; and on the Garonne and Dordogne in France, the *mascaret*.

When the rise of the tide begins, the surface of the water is disturbed in mid-channel; but the water is not broken, it is merely like a common wave. But as this rapid rise elevates the surface suddenly above the level of the flat sands, the water immediately rushes over them with great velocity, and with a broken front, making a great noise. And this is the whole of the *bore*.
Airy, Encyc. Metrop., Tides and Waves, p. 514.

bore[3] (bōr), *v. t.*; pret. and pp. *bored*, ppr. *boring*. [This word, verb and noun (the noun in senses 1 and 2 appar. preceding the verb), came into use about the middle of the 18th century; usually considered a particular use of *bore*[1], and compared with G. *drillen*, bore, drill, also bore, weary; but an immediate derivation from *bore*[1] is philologically improbable, though it may be explained as a twist of fashionable slang (to which, indeed, the word has always belonged), perhaps resting on some forgotten anecdote. At any rate, the word is now independent of *bore*[1].] **1.** To weary by tedious iteration or repetition; tire, especially in conversation, by insufferable dullness; tease; annoy; pester.

L. *vesci*, eat.] The science of plants. It treats of the forms of plants, their structure, the nature of the tissues of which they are composed, the vital phenomena connected with them, the arrangement of them into larger and smaller groups according to their affinities, and the classification of these groups so as to exhibit their mutual relations and their position in the vegetable kingdom as a whole. The science further investigates the nature of the vegetation which at former epochs lived on the earth, as well as the distribution of plants at the present time. It is thus divided into several sections. (*a*) *Structural* or *morphological botany*, that branch of the science of botany which relates to the structure and organization of plants, internal or external, independently of the presence of a vital principle. Also called *organography.* (*b*) *Physiological* or *biological botany*, that branch which relates to the history of vegetable life, the functions of the various organs of plants, and their minute structure and method of growth. (*c*) *Descriptive botany*, that branch which relates to the description and nomenclature of plants. Also called *phytography.* (*d*) *Systematic botany*, that branch which relates to the principles upon which plants are to be classified or arranged with reference to their degrees of relationship. The system of classification now universally adopted is that proposed by Antoine Laurent de Jussieu, and improved and enlarged by De Candolle, Brown, and others. It is generally called the *natural* system, because it is intended to express, as far as possible, the various degrees of relationship among plants as these exist in nature, and to group next to each other the various species, genera, and orders which are most alike in all respects. Several artificial systems have been proposed, as that of Tournefort, based on the modifications of the corolla; but the best-known is that of Linnæus, founded on the stamens and pistils. This system, which was designed by Linnæus to be only temporary, proved of great value to the science of botany, but it has now gone entirely out of use, or is used only as a partial index to the vegetable kingdom. (*e*) *Geographical botany*, that branch which relates to the natural distribution of plants over the globe, and to the inquiry into the causes which have influenced or maintain this distribution. (*f*) *Paleontological* or *fossil botany*, that branch which embraces the study of the forms and structures of the plants found in a fossil state in the various strata of which the earth is composed.

=**Syn.** *Boundary*, *Bound*, *Border*, *Confine*, *Frontier*. A *boundary*, in its stricter sense, is a visible mark indicating a dividing-line between two things, or it is that line itself; it marks off a given thing from other things like in kind, as one field or country from another. A *bound*, on the other hand, is the limit or furthest point of extension of one given thing, that which limits it not being specially considered; it can be used of that which is not limited by anything like in kind: as, the *boundaries* of a field, but the *bounds* of space; the *boundaries* of a science, but the *bounds* of knowledge. Hence the figurative uses of *bound*: as, "I believe I speak within *bounds*," where *boundaries* would be absurd. Thus, the *bounds* of a parish may be defined by certain marks or *boundaries*, as heaps of stones, dikes, hedges, streams, etc., separating it from the adjoining parishes. But the two words are often interchangeable. A *border* is a belt or band of territory lying along a *bound* or *boundary*. A *confine* is the region at or near the edge, and generally a narrower margin than a *border*. A *frontier* is a *border* viewed as a front or place of entrance: as, he was met at the *frontier*. The word is used most in connection with military operations: as, their *frontiers* were well protected by fortresses.

Bovidæ (bō'vi-dē), *n. pl.* [NL., < *Bos* (*Bov-*), ox, + *-idæ.*] A family of hollow-horned ruminants, the ox tribe, containing the bovines. The family was formerly nearly coextensive with the genus *Bos* in a large sense, including cattle as distinguished from goats, sheep, and antelopes. In this acceptation the family corresponds to the modern subfamily *Bovinæ.* It has been found impossible, however, to draw any sharp dividing line between cattle and other hollow-horned ruminants, among some of which, as the antelopes, connecting links occur. Therefore, notwithstanding the familiar difference between an ox and a sheep, for example, or a goat and an antelope, the family *Bovidæ* now contains all of these which have hollow, persistent horns, common to both sexes, generally two, sometimes four, and certain common cranial characters by which they collectively differ from the saiga on the one hand and from the pronghorn on the other, these two so-called antelopes being made respectively the types of the families *Saigidæ* and *Antilocapridæ.* The *Bovidæ* as thus defined are conventionally divided into five subfamilies: *Bovinæ*, cattle; *Ovibovinæ*, muskoxen; *Ovinæ*, sheep; *Caprinæ*, goats; and *Antilopinæ*, antelopes. See these words.

The head is carried low upon a short neck, the legs are relatively short, with the canon-bones little or no longer than the phalanges, the hoofs broad, the muffle naked, the horns simple and unbranched, and the tail tufted at the end. There are four inguinal teats. The leading genera are *Bos, Bubalus, Anoa, Bison*, and *Poëphagus*, or oxen, buffaloes, bisons, and yaks.

2. A weapon consisting of a strong strip of elastic wood or other elastic material, with a string stretched between its ends, used for shooting arrows. When the bow has been bent to its full extent by pulling the string back from it, the recoil of the string (against the inner side of which the notch of the arrow is placed) when released impels the arrow. The bow and arrow have been used in all ages and by many peoples as a weapon, and, though superseded in the advance of civilization by firearms, are still in use among savage tribes, and are the officially recognized weapon of the Manchu garrisons of China, where archery is still one of the subjects of examination for officers in the regular army. Bows were at one time divided into *longbows* and *crossbows*. During the middle ages the nations of Europe used longbows of 5 or 6 feet in length, the shorter ones being used by horsemen, and the longer by the foot-archers. The bows now commonly used in archery are of two kinds, the self-bow and the composite, backed, or union bow. The self-bow is made of one staff (or of two staves spliced endwise) of hickory, lancewood, or yew, the last, if perfectly free from knots, being considered the most suitable wood. The composite bow is made of two or three pieces of wood or other material glued together longitudinally.

These, being rubbed with resin and drawn over the strings of the instrument, cause it to sound. (*b*) An implement consisting of a piece of wood curved, and having a string extended from one extremity to the other, used (1) by smiths in turning a drill, (2) by turners in turning wood, and (3) by hatters in preparing fur and wool for their use.

Phila. Record, No. 4529, p. 2.

Boycotting was not only used to punish evicting landlords and agents, tenants guilty of paying rent, and tradesmen who ventured to hold dealings with those against whom the [Land] League had pronounced its anathema; but the League was now strong enough to use this means as an instrument of extending its organization and filling its coffers. Shopkeepers who refused to join and subscribe received reason to believe that they would be deprived of their custom; recalcitrant farmers found themselves without a market for their crops and cattle.

Brachiopoda (brak-i-op′ō-dä), *n. pl.* [NL., < Gr. *βραχίων*, arm, + *πούς* (*ποδ-*) = E. *foot*.] A class of mollusk-like animals distinguished by the development of two labial (generally called *brachial*) appendages, diverging from either side of the mouth. The animal is invested in a mantle which extends laterally and forward, is highly vascular, and secretes a shell composed of dorsal and ventral valves opening aborally; it is without foot or branchiæ, respiration being effected by the branchial mantle. By the older naturalists the species were regarded as bivalve shells, or at least as true mollusks; but by later writers they have been separated as representing (alone or with *Polyzoa*) a peculiar branch or subkingdom *Molluscoidea*, and approximated to or associated with the worms, *Vermes*. The class is generally divided into two subclasses or orders, *Arthropomata* or *Clistenterata*, and *Lyopomata* or *Tretenterata*. The families of the inarticulate or lyopomatous brachiopods are the *Lingulidæ*, *Craniidæ*, and *Discinidæ*, all of which have living representatives. Unknown in the older sacred literature, Brahma becomes by degrees an object of adoration to the Brahmans, and is artificially combined into a trimurti or trinity with Vishnu and Siva, being regarded as Creator, while Vishnu is Preserver, and Siva is Destroyer. Brahma was never worshiped by the people, and only one temple sacred to him is known. By modern Hindus he is represented as a red-colored figure, with four heads and four arms, and often accompanied by his vehicle, the swan.—**Day of Brahma.** See *day*[1].

The *dark brahma* cock shows a breast of solid black or black mottled with white, hackle and saddle silver-white, wing-bows white, wing-bars green-black, primaries and secondaries black edged with white, tail glossy green-black; while the hen is of a uniform gray color, each feather penciled with darker gray, or black. Brahman, Brahmin (brä′man, -min), *n.* [Formerly also *Brachman, Brackman*, etc. (L. *Brachmānæ, Brachmanes*, Gr. Βραχμᾶνες, pl.); < Hind. *brāhman*, corruptly *bāman*, < Skt. *brāhmaṇa′*, m. (*brāhmaṇī′*, f.), < *brah′man*, prayer, etc.: see *Brahma*[1], *Brahm.*] A member of the sacred or sacerdotal caste among the Hindus. From being in the beginning individuals and families distinguished for wisdom, sanctity, and poetic power, they gradually consolidated their influence and became a strictly hereditary class, holding in their hands the ministry of holy things, the custody of the scriptures and knowledge of their sacred and learned dialect, and the performance of the sacrifice. They were held to be created from the mouth of Brahma, to be inviolable, and entitled to the worship of the other castes. Theoretically, the life of a Brahman was divided into four stages, those of student, householder, anchorite, and ascetic. In later times the relations and occupations of the castes have become much confused, and Brahmans are to be found in every grade of dignity and of very various modes of life. There are many subdivisions of the caste, more or less isolated, and refusing intercourse with one another. Also written *Bramin.*—**Brahman's-bead**, the name given in India to the seed of *Elæocarpus*, made into rosaries for the priests, and into bracelets, necklaces, etc.

Brahmoism (brä′mō-izm), *n.* [< *Brahmo(-Somaj)* + *-ism.*] The tenets of the Brahmo-Somaj.

Brahmo-Somaj (brä′mō-sō-mäj′), *n.* [< Hind. *brahma*, Brahma (prayer), + *samāj*, society, assembly, lit. a worshiping assembly. See *Brahma*[1], *Brahman.*] A monotheistic religion in India, which originated with Rajah Ram Mohun Roy, a Hindu reformer, who died in 1833, and received a new impulse and a new direction under his successor, Keshub Chunder Sen, who died in 1885. The mystical theology of the Brahmo-Somaj can only be proximately stated in the language of Occidental philosophy. Its fundamental tenet is the universal presence of the Divine Spirit, who pervades all nature and inspires all who are willing to receive him. Man is equipped for this purpose with a faculty of spiritual insight, a faith-faculty, called *Yoga*. Inspiration is a universal fact, and all the great world-teachers have been divinely inspired prophets; all the great world-religions contain some divine truth; and in all their great sacraments there is some spiritual benefit. It is not clear whether Christ is regarded as simply the greatest of these inspired prophets, or as something more. Some utterances indicate a recognition of his character as divine. The Brahmo-Somaj differs from Deism in teaching the personal communion of the soul with a personal God, and from Christianity in not teaching any specific revelation of a remedy for sin. It is an aggressively missionary religion, and its preaching has been accompanied by works of practical reformation, such as the abolition among its adherents of polygamy, of caste, and of idolatry in all its forms, the reformation of marriage customs, and a temperance reform.

Side view of Human Brain and upper part of Spinal Cord, the skull and other coverings being removed.

C, C, C, cerebrum, or brain proper, showing the convoluted surface of the right cerebral hemisphere; *Cb*, cerebellum, or little brain—the striated surface of its right half; *MOb*, medulla oblongata; *N*, the spinal cord with beginnings of the spinal nerves; *B*, body of sixth cervical vertebra; *Sp*, its neural spine, or spinous process.

In *anat.*, the soft grayish and whitish mass filling the cranial cavity of a vertebrate, consisting of ganglionic nerve-cells and nerve-fibers, with the requisite sustentacular and vascular

tissue; the encephalon (which see); the part of the cerebrospinal axis which is contained in the cranium. It is divided by anatomists into—(1) the *prosencephalon*, comprising the cerebral hemispheres (or lateral halves of the cerebrum) with the olfactory lobes; (2) the *thalamencephalon*, comprising the thalami optici, and other parts about the third ventricle; (3) the *mesencephalon*, comprising the parts about the Sylvian aqueduct, corpora quadrigemina above and crura cerebri below; (4) the *epencephalon*, comprising the cerebellum and pons Varolii; and (5) the *metencephalon* or *medulla oblongata*, extending from the pons to the foramen magnum. The prosencephalon is now usually divided into the *rhinencephalon*, or olfactory lobes, and prosencephalon proper. The thalamencephalon is also called *diencephalon*. By Huxley and others the epencephalon of the above nomenclature is called *metencephalon*, and the next segment (the fifth) is then named *myelencephalon*. Common English equivalents of the above five segments are *forebrain*, *'tweenbrain*, *midbrain*, *hindbrain*, and *afterbrain*; these are terms translated directly from the nomenclature of the German anatomists, who call them respectively *vorderhirn*, *zwischenhirn*, *mittelhirn*, *hinterhirn*, and *nachhirn*. Haeckel calls them *protopsyche*, *deutopsyche*, *mesopsyche*, *metapsyche*, and *epipsyche*. These five segments are fundamentally distinct, and correspond embryologically to as many cerebral vesicles or brain-bladders which arise from three primitive vesicles by subdivision. The simplest and a common division of the brain is into the *cerebrum* or brain proper, the *cerebellum* or little brain, the *pons Varolii*, and the *medulla oblongata*. (See cuts under *cerebral* and *corpus*.) The human brain is distinguished for the relatively enormous size and surface-complexity of the cerebrum or prosencephalon, which completely covers the cerebellum and olfactory lobes, and is marked by many deep fissures or sulci separating gyri or convolutions. The cerebrum is divided into right and left halves, or cerebral hemispheres, connected by the great transverse commissure or corpus callosum. Each hemisphere is divided into three primary lobes, frontal, parietal, and occipital, and many more detailed subdivisions of its surface are recognized. The interior of the brain (which is primitively hollow) is traversed in the adult by a set or system of connected cavities known as *ventricles* or *cœliæ*. The first and second of these are the right and left ventricles of the hemispheres, or *procœliæ*; the third is the *diacœlia*; the fourth is the *epicœlia*; passages connecting these are the foramina of Monro and the aqueduct of Sylvius. The brain and adjoining portions of the spinal cord give rise to 12 pairs of nerves, called *cranial nerves* because they emerge from foramina in the base of the skull. (See *cranial*.) Brain-substance is of two kinds, gray ganglionic or cellular nerve-tissue, and white commissural or fibrous nerve-tissue. The gray matter which invests the cerebrum and cerebellum is also called the *cortical* substance, in distinction from the white or *medullary* substance of the interior. A brain is in fact a collection of gray ganglia united by white commissures. Besides the cortex, there are several ganglia or collections of gray matter in the interior, as the corpora striata, the optic thalami, the optic lobes or corpora quadrigemina, the corpora dentata of the cerebellum, and the corpora olivaria of the medulla oblongata. Connected with the brain are two non-nervous structures, the conarium or epiphysis cerebri and the pituitary body or hypophysis cerebri. The brain is covered by three membranes or *meninges*, of which the external is the dura mater, the middle the arachnoid, and the inner the pia mater. Most mammals have a brain like that of man, but in descending the mammalian scale the cerebrum becomes relatively smaller and has fewer if any convolutions, the corpus callosum becomes rudimentary, and the olfactory lobes enlarge. (See cuts under *gyrus* and *sulcus*.) In the brain of birds the hemispheres are smooth, there is no corpus callosum or pons Varolii, and the optic lobes are of immense size. There is no brain in the lowest vertebrate, *Amphioxus*. The average weight of the brain in adult males of the European type is about 1,400 grams (49.5 ounces); in women about 1,250 grams (44 ounces). The brain is in its highest activity the organ of consciousness or mind, and its general function is that of furnishing the most complex and extensive outgoing stimulation of muscles and other active tissues as a response, more or less immediate, to the most complex and extensive incoming sensory stimulation. With functions of this high degree of complexity are associated in some parts much simpler functions resembling those of the spinal cord. The cortex of the cerebral hemispheres is the portion of the brain in which the most complex coördinations seem to be effected, and which is most directly involved in mental acts. Certain parts of the cortex are, however, peculiarly related to certain special incoming or outgoing stimulations, and are called sensory or motor centers. (See *cerebral*, and *cerebral localization*, under *localization*.) The corpus striatum is usually regarded as especially concerned with stimulations passing downward, and the optic thalamus with those passing upward; among the latter, those of sight are connected with the hinder part of the thalamus. The nates are involved in the sight-function, and the testes seem to have close relations with the stimuli entering by the auditory nerve. The cerebellum is concerned with the coördination of muscular contractions in the carrying out of voluntary actions, while the medulla oblongata contains a large number of centers for comparatively simple functions, as vasomotor action, cardiac action, respiration, deglutition, etc. (See also cut under *encephalon*.) From its complexity, the brain is usually spoken of in the plural in certain relations: as, to beat out or to rack one's *brains*.

The nerves of the eyes and antennæ are directly connected with it, and it gives off two inferior branches which surround the esophagus and unite beneath in the subesophageal ganglion. Sometimes this ganglion is regarded as a part of the brain, being distinguished as the *cerebellum*, while the principal or upper ganglion is called the *cerebrum*.

In Gegenbaur's system a third prime division, *Protracheata*, established for *Peripatus* alone, intervenes between *Branchiata* and *Tracheata*. The *Branchiata* are primarily divided into *Crustacea* proper (including the two main groups of *Entomostraca* and *Malacostraca*) and *Pœcilopoda*, represented by *Limulus*, etc. (*b*) A division of vertebrates containing those which for some time or permanently breathe by gills; the amphibians and fishes, as distinguished from reptiles, birds, and mammals: synonymous with *Ichthyopsida* (which see). ★**brass**[1] (brås), *n.* and *a.* [< ME. *bras, bres*, < AS. *bræs*, brass, whence Gael. *prais*, Ir. *pras*, W. *pres*, brass; not related to Icel. *brasa*, harden in the fire, = Sw. *brasa*, flame, = Dan. *brase*, fry, > F. *braser*, solder (see *braize*[1]); cf. OSw. and Sw. *brasa*, fire, Icel. *brass* (occurring once), a cook. Hence *braze*[2], *brazen, brassen*, etc.] **I.** *n.* 1. An important alloy, consisting essentially of copper and zinc. The proportion in which the two metals are combined differs considerably in different kinds of brass. Brass in general is harder than copper, and consequently wears better than that metal. It is malleable and ductile, so that it can be easily rolled into thin sheets, or be hammered into any desired shape. It turns easily in the lathe, and can be drawn into fine wire; moreover, it has an attractive golden color, and is cheaper than copper. The color of brass varies with the proportions of the ingredients. A full yellow variety contains about two parts of copper to one of zinc. This alloy was known to the ancients, and was made by them before they had any knowledge of the metal zinc as such. It is not among the metallic substances mentioned by Homer; but it was well known to Strabo, who describes the mode of manufacturing it from the zinkiferous ore (calamin), and calls the alloy *orichalc* (*ὀρείχαλκος*). See *orichale, pinchbeck, prince's metal, mosaic gold, Muntz's metal*, and *yellow metal.* In rhetorical comparisons, brass is a common type of hardness, durability, or obduracy.

In *medieval archæol.*, a funeral monument consisting of a plate of brass, usually of rectangular shape and often of large size, incised with an effigy, coats of arms, inscriptions, and frequently accessory ornament. Such brasses are sometimes splendidly enameled. In some examples the designs are executed in relief, or in relief in combination with engraving. Slabs of stone inlaid with figures, etc., in brass are also called brasses, and are a usual form of medieval monument. Both the plates of brass and the inlaid stones were frequently placed in the ordinary pavement of churches. Comparatively few of such monuments executed wholly in brass survive, as the value of the metal has caused it to be melted down and applied to other uses.

=**Syn. 1.** *Gallant, Valiant, Courageous, Brave, Heroic,* valorous, dauntless, chivalrous, doughty, resolute, manful. *Gallant*, splendid in dress or qualities, is most appropriately used with regard to courage which exhibits itself in deeds attracting attention and applause; of the first four words it is that which may have in it most of compliment and least of high commendation, but it is often a strong word, expressing splendid bravery in action: as, he was a *gallant* officer. *Valiant* is also brave in action, especially in opposing physical force, as in battle. The word is now elevated and poetic. *Courageous* denotes the possession of that spirit which enables one fearlessly and with full presence of mind to face danger. *Brave* is the most comprehensive of the words; it may denote the possession of the highest and noblest kind of courage and fortitude, of that spirit which enables a man to bear up against evil and danger, as well as to go forth to face it. *Courageous* has much of this breadth of meaning, but is applicable rather to doing than to enduring; *brave* is both passive and active. *Heroic* combines the meaning of all the other words in the superlative degree. It indicates a lofty superiority to fear, a noble self-forgetfulness, an almost superhuman power to dare, achieve, or suffer. It bears the same relation to the other words that *sublime* bears to *great, grand,* or *lofty.*

Perhaps akin to *brow*; cf. OBulg. *brŭvi*, a bridge, also brow: see *brow*.] **1.** Any structure which spans a body of water, or a valley, road, or the like, and affords passage or conveyance. Bridges are made of various materials, principally stone, iron, and wood, and in a great variety of forms. In an *arch-* or *arched bridge* the passage or roadway is carried by an arch or arches, which are supported by abutments or by piers. Such bridges are constructed of brick, stone, iron, steel, or wood. Brick is seldom used alone, except for comparatively small spans, and for unimportant work when stone cannot readily be obtained. In more important works it is often combined with stone, which is introduced to bind, to distribute pressure, to protect the more exposed portions, and for architectural effect. Stone, wherever it can be used, is the most valuable material, on account of its massiveness, stability of form, and resistance to the elements; but it is inferior to iron in economy, facility of construction, and ready adaptability to various situations. Among the finest monuments of antiquity are ranked the remains of Roman arched stone bridges. The largest stone arch known is that built over the Petrusse valley in Luxemburg (span 275½ feet); the next is that of the Washington aqueduct over the Cabin John Creek (span 220 feet; rise 57.25 feet). The first arched bridge built of iron was erected over the river Severn, in England, and consists of 5 parallel ribs of cast-iron, with a span of 100 and a rise of 40 feet. The Southwark bridge over the Thames at London, the central one of the three arches of which has a span of 240 with a rise of 24 feet, formerly ranked as the largest iron arched bridge; but this span has since been more than doubled, as notably in the bridge over the Mississippi at St. Louis, and the Washington bridge over the Harlem river in New York city. In an *arched-beam bridge* arched beams in compression constitute the principal members and sustain the load. The beams are sometimes built of parallel layers of planks, which are made to break joint. In the more important constructions the arches are often compound. They have been employed in modern bridges of considerable magnitude. An *arched-truss bridge* is a form in which the compression-member is an arched beam, as in the McCallum truss. In a *beam-truss bridge* the load is supported by beam-trusses or openwork beams. A compression-chord and a tension-chord are essential, and the stresses are transferred from one to the other on their way to the points of support by means of struts and tension-bars, which together are called web-members. See phrases below for other forms.

2. The upper line or ridge of the nose, formed by the junction of the two nasal bones.—**3.** In *engraving*, a board resting on end-cleats, on which the engraver rests his hand in working. In etching two bridges are used: one with low feet or cleats, to serve for work on the unbitten plate; the other with higher feet, to raise it above the bordering-wax after it has been applied.

4. A wall, generally made of fire-brick, which is built at both ends of a reverberatory furnace, to a certain height, in order to isolate the space in which the metallurgical operation is conducted. The wall nearest the fireplace is called the *fire-bridge*; the other, at the opposite end, the *flue-bridge*.

5. In *gun.*, the two pieces of timber which connect the two transoms of a gun-carriage. [Eng.]—**6.** In *metal.*, the platform or staging by which ore, fuel, etc., are conveyed to the mouth of a smelting-furnace.—**7.** That part of a stringed musical instrument over which the strings are stretched, and by which they are raised above the sounding-board. In bow-instruments, such as the violin, the bridge is arched, in order to allow the bow to strike any one string alone.

8. *Naut.*, a raised platform extending from side to side of a steamship above the rail, forward of amidships, for the use and convenience of the officer in charge. It affords him an uninterrupted view, and is furnished with means for communicating, by automatic signals, with the engine-room and the wheel-house. Many large vessels have two bridges, one forward of and one abaft the mainmast; and it is now very common for the bridge to be made in two tiers, one above the other, with often an outlook-station still higher than the upper tier. In side-wheel steamers the bridge connects the paddle-boxes.

9. A metal bar supported at one or both ends of a watch-plate, and forming a bearing for a part of the works.—**10.** The balance-rynd of a millstone.—**11.** In *car-building*, a timber, bar, or beam which is supported at each end.—**12.** In *euchre*, a position where one side has scored four points and the other only one.—**13.** In *elect.*, an apparatus for measuring the resistance of a conductor, the arrangement of whose parts bears some resemblance to a bridge. A common form is called *Wheatstone's bridge*, from the inventor. See *resistance*.—**14.** In *billiards*, a notched piece of wood, attached to a long handle, used as a support for the cue when the ball is in such a position that the hand cannot conveniently be used as a rest.—**15.** See *bridge*[2], in supplement.—**Asses' bridge.** See *pons asinorum*.—**Bottom-road bridge,** a bridge whose roadway is supported upon the lower chord in a truss-bridge, or at the bottom in a tubular bridge. Also called *through bridge*. See cut under definition 8. Opposed to *deck-bridge* or *top-road bridge*.—**Box-girder bridge.** More commonly called *tubular bridge* (which see).—**Cantaliver bridge,** a bridge in which the span is formed by bracket-shaped beam-trusses, extending inward from their supports and connected at the middle of the span either directly or by an intermediate truss of ordinary construction. When piers are used to support the beam-trusses, they are placed near the center of each truss, and not, as in ordinary truss-bridges, at its ends. The strains due to a load upon the span are carried outward toward the ends of the bridge and beyond the piers by bracket-arms similar to those forming the central span, the extremities of which may be secured to other piers to serve the twofold purpose of resisting by their weight the uplift caused by the load when upon the central span and of themselves supporting vertical pressure; or they may form part of other spans similar to the central one. This form of bridge presents the great advantage of permitting the construction of the main span without scaffoldings beneath. A fine example is the cantaliver bridge below Niagara Falls, built for the Michigan Central and Canada Southern railways.—**Check-bridge of a furnace,** a fire-bridge: so called because it was supposed to check the draft.—**Counterpoise bridge,** a bascule-bridge in which counter-weights help to raise the platform.—**Electric bridge,** a term applied to several contrivances for determining the resistance of an electric circuit, all essentially identical with Wheatstone's bridge (which see, under *resistance*).—**Floating bridge.** (*a*) A boat, raft, or pontoon bridge. (*b*) A part of a bridge, supported by a caisson or pontoon, which can swing into and away from the line of roadway. (*c*) *Milit.*, a kind of double bridge, of which the upper member projects beyond the lower, and is capable of being moved forward by pulleys: used for carrying troops over narrow moats in attacking the outworks of a fort.—**Flying bridge,** a suspension-bridge, or a bridge built for temporary use, as a pontoon bridge.—**Hanging bridge,** a suspension-bridge. The term is generally applied to the more primitive forms of suspension-bridge.—**Hoist-bridge.** Same as *lifting bridge*.—**Induction-bridge.** See *induction*.—**Lattice-bridge,** a bridge in which the web between the chords or the main compression- and tension-members is formed by lattice-work.—**Leaf-bridge,** a hinged lifting bridge.—**Lifting bridge,** a drawbridge the span of which moves in a vertical plane instead of horizontally. Also called *hoist-bridge*.—**Pivot-bridge,** a swinging bridge balanced upon a pivot. It is often formed by two equal spans, covering a channel on each side of the pivot-pier.—**Pontoon bridge,** a platform or roadway supported upon pontoons. Bridges of this kind are largely used in military operations, the pontoons being formed of air-tight bags or hollow metallic vessels.—**Rope bridge,** a hanging bridge consisting of a platform supported by ropes, or simply of a rope carried across the stream or chasm, and supporting a basket or car which is drawn backward and forward. Such bridges are used in mountainous districts, especially in India and South America, and are sometimes made of sufficient strength to afford passage to droves of loaded mules. surface, the lower one terminating almost in a point. The manner in which the brilliant is derived from the fundamental octahedral form (*a* in fig. 1) is shown in fig. 1, *b* and *c*. The uppermost large flat surface is called the *table*, and is formed by removing one third of the thickness of the stone; the opposite small end, called the *culet* or *collet*, is formed by removing one eighteenth of the thickness of the stone. The *girdle* is the widest part, and forms the junction-line between the upper part, called the *crown*, and the lower part, called the *pavilion*. Fig. 2 shows the top (*a*), side (*b*), and back (*c*) views of a modern brilliant cut with 58 facets. *T* is the table; *C*, the culet; *G*, the girdle; *A*, the templets or bezels (of which there are 4 in all); *B*, the upper quoins or lozenges (of which there are 4); *S*, star-facets (of which there are 8 in the crown); *E*, skill- or half-facets (8 in the crown and the same number in the pavilion); *D*, cross- or skew-facets (8 in each part); *P*, pavilion-facets (4 in number); *Q*, lower or under-side quoins (of which there are 4)—making 58 facets in all. bronze (bronz), *n.* and *a.* [= D. *brons* = G. *bronze* = Dan. *bronze* = Sw. *brons* < F. *bronze* = Sp. *bronce* = Pg. *bronze* = Cat. *bronse*, *bronze* (cf. Bulg. Serv. The proportion of copper in various bronzes is usually between 80 and 90 per cent.; in some it falls as low as 70. The proportion of tin in the bronzes of different ages and those used for various purposes is almost as variable as that of copper. Bronze used for bells has the largest amount of tin; in some it reaches 25 per cent. The bronze formerly used for cannon contained about 10 per cent. of tin and often a small amount of zinc. Statuary bronze is, and has been from the beginning of its use for the purpose, of very variable composition. In some statuary called bronze there is less than 1 per cent. of tin, while zinc is present in sufficient quantity almost to justify calling the material brass. The zinc in various pieces of statuary cast within the past two or three hundred years, and erected in some of the principal cities of Europe, varies in quantity from less than 1 per cent. to 25. Lead is present in many bronzes, but usually in small amount, rarely being as much as 3 per cent. Bronze is an alloy of importance to both the arts and commerce, and is also of great historical interest, since it has been known from remote ages over a large part of the world. It is preferred to simple unalloyed copper, on account both of its color and of its greater durability. Among prehistoric races the use of bronze preceded that of iron; and among their remains are found swords, axes, and other cutting instruments of this material, sometimes artistically made and ornamented, as well as domestic implements and utensils of many kinds. The ancient Greeks, Romans, etc., made statuary of it in enormous quantities, and also coins, recording tablets, and a great variety of articles of common use. It is now not only used for cannon (for which purpose it has been to a great extent supplanted by steel), bells, and statuary, but also for parts of various machines, especially bearings, and for screw-propellers. The beauty and durability of bronze statuary depend in no small degree on the color and composition of the oxidized film or incrustation which forms upon it when it is exposed to the weather. This is called its *patina* (which see). In recent times numerous experiments have been made with a view to improve the quality of bronze in various ways, in particular by the addition of small quantities of other substances, especially metals. The most important result of these experiments seems to be *phosphor-bronze*, an alloy patented by two Belgian metallurgists about 1870, and now extensively used where toughness and resistance to wear are required. The amount of phosphorus in phosphor-bronze is less than 1 per cent., and the effect it produces is probably due to its reducing action on the oxids of the other metals during the process of manufacture. Phosphor-bronze is of finer grain and color, and is believed to be much more durable, than ordinary bronze; and it is thought by many that it will eventually be proved to be the best material for artillery. Extensive experiments have also been made with manganese, lead, and other metals. *Aluminium bronze* is an alloy of copper and aluminium now in use, especially where tensile strength is required. So-called *steel bronze* is bronze hardened by mechanical compression. It has not come into general use, but was intended by its inventor to be used for cannon. See *aluminium*.

(*b*) In New England, hash or minced meat.—**South Sea bubble**, a financial scheme which originated in England about 1711 and collapsed in 1720. The refusal of Spain to enter into commercial relations with England made the privileges of the company worthless; but by means of a series of speculative operations and the infatuation of the people its shares were inflated from £100 to £1,050. Its failure caused great distress throughout England.

Its essential principles, in so far as they can be reduced to an Occidental form of thought, are, that man is under the operation of certain inflexible laws, from which there is neither escape nor deliverance; existence under them is an evil; priestly rites and sacrifices are unavailing; death is no escape, but only a transmigration to another form of existence; obedience to the moral laws—the practice of charity, temperance, justice, honesty, truth—insures a sojourn in heaven, followed by a higher existence on the

earth; disobedience insures a punishment in some of the innumerable hot and cold hells (see *naraka*), situated in the interior of the earth or on its furthest verge, followed by a lower state of existence on earth; the supreme felicity to be attained by perfect obedience is the suppression of every passion and desire, and eventually Nirvana, or unconscious existence, if indeed Nirvana be not annihilation. In its original spirit agnostic, if not atheistic, it has become modified in time, and now has its rites and temples, which vary in different nationalities and localities. From India Buddhism spread over Ceylon, Java, Cochin-China, Burma, Tibet, Mongolia, Tatary, China, and Japan, but was stamped out in India by the rise of Hinduism. Also spelled *Boodhism*.

II. *a.* Of or pertaining to Buddha or Buddhism.—**Buddhist architecture**, the oldest and most characteristic native style of Indian ecclesiastical architecture, the earliest specimens dating from 250 B. C., and prevailing wherever Buddhism has been established. Buddhist architectural monuments may be classed in five groups: (*a*) Stambhas or lâts, pillars bearing inscriptions on their shafts, with emblems or animals on their capitals. (*b*) Stupas or topes, large towers, some built in the form of a hemisphere, others partly cylindrical and finished at the top with either a flat circle or a pointed dome-like terminal. The topes were erected in honor of some sacred event or place, and are sometimes employed to contain relics of Buddha or of a saint. In the latter case the tope is called a *dagoba*. (*c*) Rails, formed of elaborately sculptured pillars, built around topes, temples, and other sacred objects. (*d*) Chaitya halls, cut out of the living

His [Alfred's] *budget* is the first royal *budget* we possess; and though the fact that the national expenses were still in the main defrayed by local means renders any comparison of it with a modern *budget* impossible, it is still of interest as indicating the wide range of public activity which even now was open to an English king.

=**Syn.** *Bulky*, *Massive*, *Massy*, *Ponderous*, *Burly*. *Bulky* refers to prominence, excess, or unwieldiness of size; it applies properly to material things; if applied to persons, it implies the development of physical size at the expense of higher qualities. *Massy* is, strictly, poetic for *massive*. The two denote weight and solidity quite as much as size, while that which is *bulky* may be hollow and comparatively light: as, a *bulky* bundle of straw; a *massive* jaw; "ingots of *massy* gold." *Ponderous* primarily denotes weight and not size, but has come to have a secondary suggestion of unwieldiness. *Burly* is applicable only to persons, and expresses bigness, solidity, and force, with something of coarseness of manner.

In 1603, Jonson produced his mighty tragedy of Sejanus, a noble piece of work, full of learning, ingenuity, and force of mind in wielding *bulky* materials.

bull[2] (bůl), *n.* [< ME. *bulle*, < OF. *bulle*, F. *bulle* = It. *bolla*, *bulla* = D. *bul*, *bulle* = G. Dan. *bulle* = Sw. *bulla* = Icel. *bōla* (in *bann-bōla*, a bull of excommunication), < ML. *bulla*, a papal edict, any edict or writing, a seal, L. *bulla*, a boss, knob, stud, bubble: see *bulla*, *bill*[3], *billet*[1], *bullet*, *bulletin*, *boil*[2], *bowl*[2], etc.] **1.** Same as *bulla*, 2.—**2.** The most authoritative official document issued by the pope or in his name: usually an open letter containing some decree, order, or decision relating to matters of grace or justice. It derives its name from the leaden seal (Latin *bulla*) appended to it by a thread or band, which is red or yellow when the bull refers to matters of grace, and uncolored and of hemp when it refers to matters of justice. On one side of the seal is the name of the pope, and on the other are the heads of St. Peter and St. Paul. Bulls are written in Latin, either in the ordinary cursive hand or in round Gothic characters, and have a red seal on the parchment itself, in which the name of the pope encircles the heads of the apostles. They begin with the name of the pope, followed by the term *episcopus* (bishop) and the words *servus servorum Dei* (servant of the servants of God) and a salutation, and close with the place and date of execution and the subscription of the chancellor or other functionary of the papal chancery. The distinctive name of a bull is taken from the first word or words of the general introduction which follows the salutation: as, the bull *Unigenitus*, which begins with the words *Unigenitus Dei*, etc., issued in 1713 by Clement XI., condemning the Jansenist propositions set forth in Quesnel's "Moral Reflections." A *brief*, though of equal authority with a *bull*, differs from it in several important points, chiefly of form. It is shorter, relates to subjects of inferior importance, is written in Latin in ordinary Roman letters and on the smooth side of the parchment, uses the word *papa* instead of *episcopus* in the introductory formula, is sealed with red wax instead of lead, and with the pope's private seal, the fisherman's ring, and is never signed by the pope himself, but by a secretary of the papal chancery. Both briefs and bulls belong to a class of papal documents generically called *apostolic letters*; these are *encyclical* when addressed to the bishops of the Roman Catholic world, and from their contents are called *constitutions*, *decretals* (ancient), *synodal letters* (also ancient), *rescripts*, *motus proprii*, etc. *Consistorial bulls* are issued after consultation with the consistory of cardinals, and are signed by all the cardinals consulted.

The church published her *bulls* of crusade; offering liberal indulgences to those who served.
Prescott, Ferd. and Isa., Int.

3. An official letter; an edict; especially, an imperial edict under the Roman or the old German empire.—**Golden bull,** a name given to several celebrated historical documents, from their golden seal. The most notable of these is an edict or imperial constitution made in 1356 by the emperor Charles IV., regulating the mode of procedure in the election and coronation of the emperor.—**Leaden bulls,** the designation of official documents (from their leaden seals) sent by the emperors of Constantinople to patriarchs and princes, by the grandees of the empire, of France, Sicily, etc., and by patriarchs and bishops.

bull[4] (bůl), *n.* [Not found earlier than the 17th century, except as ME. *bul* (about A. D. 1320) in the doubtful passage first quoted. Origin uncertain. Several anecdotes involving Irish speakers have been told (and appar. invented) to account for the word. It is usually associated with *bull*[2], a papal edict, in allusion, it is said, to the contrast between the humble professions of the pope, as in his styling himself 'servant of servants,' and the absolutely dictatorial nature of his edicts. This explanation, which rests partly on the passage quoted from Milton (cf. *bullish*[2], also in Milton), below, is hardly tenable on historical grounds. The Icel. *bull*, nonsense, *bulla*, talk nonsense, chat, is mod., and, if not from the E. word, is to be associated with *bulla*, boil, and ult. with L. *bulla*, a bubble: see *bull*[3].] A gross inconsistency in language; a ludicrous blunder involving a contradiction in terms: commonly regarded as especially characteristic of the Irish, and often called an *Irish bull*.

Quilk man, quilk calf, quilk leon, quilk fugul
I sal you tel, with-vten *bul*.
Cursor Mundi (E. E. T. S.), l. 21269.

I may say (without a *Bull*) this controversy of yours is so much the more needless, by how much that about which it is (Reformation) is so without all controversy needful.
Charles Herle, Ahab's Fall (1644), Ded.

And whereas the Papist boasts himself to be a Roman Catholic, it is a mere contradiction, one of the pope's *bulls*, as if he should say universal particular; a Catholic schismatic. *Milton*, True Religion.

Hind. *bulbulā*, *bullā*, a bubble, and E. *bubble*[1], etc.; all perhaps orig. imitative.] **1.** An ornament in the form of a capsule or locket, in use among the ancient Romans, who adopted it from the Etruscans. It was worn especially around the neck as an amulet by Roman children, both boys and girls, its protective virtue being supposed to reside either in its precious material or in some substance inclosed within it. It was of gold in the families of the nobly born and the rich, and of commoner material among others. It was laid aside by young men upon attaining maturity, and dedicated to Hercules or to the household lares; by young women it was dedicated to Juno.

6. [*cap.*] A genus of tectibranchiate (or pleurobranchiate) gastropods, to which very different limits have been assigned. (*b*) By recent writers it is restricted to the bubble-shells, so called from their ventricous oval shells, so convoluted that the last whorl envelops all the others: typical of the family *Bullidæ*.
